

Trust/Link SSL

Organisations often struggle to control their use of SSL Certificates across their variety of business units and locations. QuoVadis' Trust/Link SSL allows these organisations to centrally manage SSL use and to rapidly issue Certificates on demand, while providing flexibility for different business units to define their own request and approval processes.

With Trust/Link SSL, QuoVadis pre-validates the domains and corporate details most commonly used in your SSL Certificates. This means that your authorised personnel are subsequently enabled to approve Certificate requests for straight-through processing, without QuoVadis intervention.

Trust/Link has three major components:

- **Administrator Control Panel:** The Trust/Link SSL control panel, with access controlled by digital certificates, provides granular administration of your groups, users, and other settings. It also allows your Administrators to manage Certificates through their entire lifecycle. Trust/Link SSL provides extensive audit trails both by Certificate and by user.
- **Subscriber Services:** Your invited Subscribers may submit Certificate Requests to your Administrators at any time with a simple password. This same site also allows those Subscribers to later download and manage (renew/revoke) all the SSL Certificates for which they are responsible from one location.
- **API:** An optional secure Web Services component allows organisations to build or use their own Web interfaces for Certificate request and revocation, interacting with Trust/Link SSL for the approval and process and Certificate production.

Trust/Link SSL incorporates customisable email alerts and reminders to facilitate the request, approval, and delivery processes.

Trust/Link SSL uses Certificate templates to ensure that your SSL Certificates will always include approved details for the Organisation identity. In addition, Administrators may update incoming Certificate Requests to correct details and to add approved SAN fields.

If desired, the system may be configured to require "second authorisation" by Administrators before Certificate approvals and revocations are processed.

Trust/Link SSL Features

- Allows immediate issuance of SSL for your authorised users.
- Bulk pricing without complex fees for additional administrators or domains.
- Complete workflow for certificate application, approval, delivery, renewal, and revocation.
- Pre-validation of frequently used Organisations and Domains.
- Extensive search, reporting, and audit capabilities.
- Assign your Administrators by Organisation or permission, allowing work distribution or separation of duties.
- Customise Certificate Request forms and alert emails by Organisation.
- Subscribers may manage all their certificates from one login.
- Extended Validation and Business SSL, including support for multiple domains in SAN fields as well as intranet use.
- Wide recognition in browsers and user software.
- UTF8-ready for internationalised domains.
